Purpose: This template provides a series of scripts to render a markdown document into an interactive website and a series of PDFs.
Motivation: It makes collaborating on text with GitHub easier, and means that we never need to think about the output.
Internals: GitHub actions and a series of python scritpts. The markdown is handled with pandoc.

Keywords:
species interactions
ecological forecasting
pollinators
bumblebees
network ecology

0.1. Abstract Using a data set of [DESCRIBE EACH DATASET IN A NICE WAY], we predict a spatiotemporally explicit metaweb of interactions between bumblebees (*Bombus*) and wildflowers (within *find clade*). We integrate this data with crowdsourced occurrence data and climate data to [best paint the picture of the Colorado bumblebee-plant metaweb]. Using temporal climate data, we forecast how the spatiotemporal overlap of interacting species will change under proposed climate scenarios. We use this to estimate what interactions between bees and plants need the most attention to prevent the spatiotemporal decoupling of an interactions from threatening ecosystem functioning or the persistence of a species.

1 _____

Introduction

- We estimate the Colorado bumblebee/wild-flower pollination metaweb using network embedding.
- Then decompose into spatial and temporally explicit network predictions
- Finally suggest a priority of sampling to improve our understanding of this system.
