**Purpose:** This template provides a series of scripts to render a markdown document into an interactive website and a series of PDFs.

**Motivation:** It makes collaborating on text with GitHub easier, and means that we never need to think about the output.

**Internals:** GitHub actions and a series of python scritpts. The markdown is handled with pandoc.

#### 1 Abstract

- 2 Using a data set of [DESCRIBE EACH DATASET IN A NICE WAY], we predict a spatiotemporally explicit
- metaweb of interactions between bumblebees (Bombus) and wildflowers (within find clade). We integrate
- 4 this data with crowdsourced occurrence data and climate data to [best paint the picture of the Colorado
- 5 bumblebee-plant metaweb]. Using temporal climate data, we forecast how the spatiotemporal overlap of
- 6 interacting species will change under proposed climate scenarios. We use this to estimate what
- 7 interactions between bees and plants need the most attention to prevent the spatiotemporal decoupling of
- an interactions from threatening ecosystem functioning or the persistence of a species.

#### 9 Introduction

- 50 Species interactions are important. It is ultimately interactions between individuals of different species
- that drive the structure, dynamics, and persistence of ecosystems, and the abundance and diversity of the
- species within them. Plant-pollinator interactions specifically drive the function and persistence of
- "architecture of biodiversity" (Bascompte & Jordano 2007). However, we are far from a robust
- understanding of plant-pollinator networks is.
- 15 In this paper, we combine several datasets, each spanning several years, to produce spatially and
- temporally explicit predictions of *Bombus* plant-pollinator interactions across the state of Colorado.
- We do this in two parts: (1) metaweb prediction and (2) conditioning our metaweb prediction on
- 18 co-occurrence probability.
- 19 First, we build a model to predict the metaweb—the network of all interactions, aggregated across all
- 20 times and spatial locations—of Bombus and wildflower species across Colorado. (Why do this? The
- 21 metaweb is more predictable than local interactions.) We do this using network embedding (cite?).
- Network embedding takes each node in the network (either a bumblebee or a wildflower) and represents
- 23 it in a latent n dimensional space. Combination of running models on Temporal niche (T), Phylogenetic
- niche (P), Environmental niche (E), and relative abundance in community (RA).
- <sup>25</sup> Second, we then use this metaweb to predict the structure of networks at specific locations and times of
- 26 year (Gravel et al. 2019).

- 27 Finally we suggest a map of sampling priority, which suggests the locations to sample that will best
- improve our understanding of the Colorado *Bombus* pollination metaweb.

#### 29 Data

We use three separate datasets to estimate the Colorado *Bombus* metaweb.
